RYNIXSOFT

DIGITAL TALENT MANAGEMENT PLATFORM

YASWANTH S S UI/UX DESIGNER

1.Project Overview

- **Role:** UI/UX Designer
- **Project Type:** HR Digital Platform
- **Goal:** Improve recruitment workflows, employee performance tracking, and career growth management.

2.Problem Statement:

Many organizations face difficulties in managing employee performance, skills, attendance, and project allocation due to fragmented systems or manual tracking methods. These traditional approaches often lead to data inconsistencies, inefficient reporting, and reduced productivity.

The concept of Talent Management was first introduced in 1997 and has since evolved into modern digital platforms. Today, organizations rely on **Digital Talent Management Systems (DTMS)** to maintain accurate employee records, track performance, and generate insights that support strategic decision-making.

How can one Digital Talent Management System effectively serve different organizations with varying needs?

The answer lies in three key capabilities:

- **Customization** – Organizations can tailor the platform to match their workflows and policies.
- **Modularity** – Different modules can be enabled based on company requirements.
- **Scalability** – The system can grow alongside the organization.

A DTMS is therefore not a rigid software solution but a **flexible framework** that adapts to diverse organizational structures and operational processes.

3.Proposed Solution

Digital Talent Management System (DTMS)

The proposed **DTMS platform** addresses these challenges by providing a centralized digital solution for managing workforce data and performance.

Key Features

Centralized Automation
All HR operations such as attendance, performance tracking, and employee records are integrated into a single platform, eliminating manual processes.

Role-Based Dashboards
Different user groups (HR, managers, employees) receive customized dashboards with relevant information and permissions.

Real-Time Analytics
The platform provides instant insights, performance metrics, and organizational reports to support data-driven decisions.

Skill & Growth Tracking
Employee skills, training progress, and career development paths are monitored to encourage continuous improvement and upskilling.

3.Target Users

The **target users** are the groups of individuals who directly interact with the Digital Talent Management System to perform their tasks.

Primary User Groups

1. HR Managers (Primary Administrative Users)
2. Team Leaders / Project Managers (Supervisory Users)
3. Employees (End Users)
4. Recruiters (Specialized Users)

Each user group interacts with the system differently based on their responsibilities.

4.User Personas

4.1. HR / Resource Manager (Admin Level)

Role
Responsible for assigning employees to suitable projects while balancing workloads and ensuring efficient resource utilization.

Main Focus

- Project resource allocation
- Managing unassigned employees (bench)
- Monitoring overall workforce performance

Daily Tasks

- Evaluate project resource requests
- Assign skilled employees to appropriate projects

Weekly Tasks

- Monitor employee workload distribution
- Ensure work is allocated fairly across teams

Project Completion Tasks

- Collect performance feedback from project managers
- Identify skill gaps and arrange training programs

4.2. Team Leader / Project Manager (Supervisory Level)

Role
Ensures successful project delivery while managing team productivity and task execution.

Main Focus

- Project progress monitoring
- Team performance management
- Task coordination

Daily Tasks

- Track team development progress
- Request additional skilled resources when required

Weekly Tasks

- Review sprint performance
- Approve timesheets
- Resolve technical challenges faced by team members

Project Completion Tasks

- Submit performance evaluations for each team member
- Assess metrics such as code quality, productivity, and delivery speed

---

4.3. Employee / Team Member (End User Level)

Role
Completes assigned tasks efficiently while continuously improving technical and professional skills.

Main Focus

- Task completion
- Performance tracking
- Skill development

Daily Tasks

- Work on assigned tasks
- Update project progress
- Log daily work hours

Weekly Tasks

- Review feedback from managers
- Communicate project challenges
- Monitor individual performance metrics

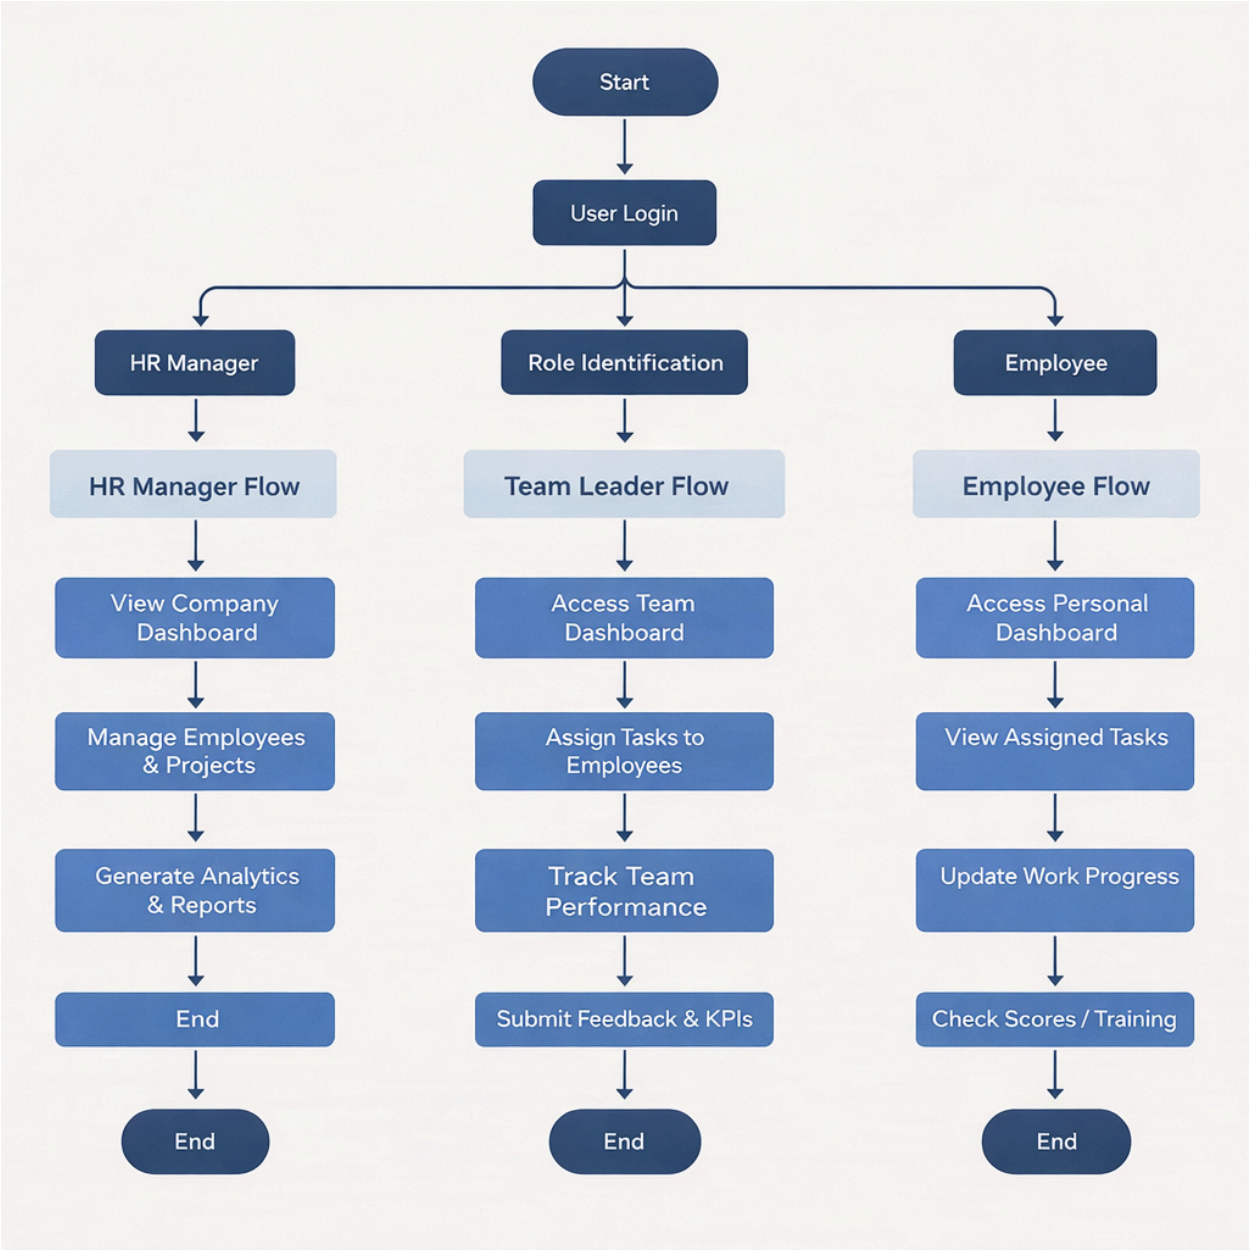
Bench Period Tasks

- Participate in recommended training programs
- Upgrade technical skills while waiting for project allocation

User Journey & User Flow

The next stage of the design process involves mapping **User Journeys and User Flow Diagrams** to understand how different users interact with the system.

These flows help ensure that the platform provides a **smooth, intuitive, and efficient user experience** for all user groups.



Conclusion

The **Digital Talent Management System (DTMS)** provides a centralized platform to manage employee performance, skills, and project allocation efficiently. It improves organizational productivity by automating HR processes and offering role-based access for HR managers, team leaders, and employees. Overall, the system helps organizations manage talent effectively and support employee growth.
